Executive Summary

In 2021, the Stanislaus Council of Governments (StanCOG) acquired the services of an engineering consultant, Nichols Consulting Engineers, Chtd. (NCE), to provide professional and technical services preparing pavement management program (PMP) updates for the Stanislaus region. The ten participating member agencies included the Cities of Ceres, Hughson, Modesto, Newman, Oakdale, Patterson, Riverbank, Turlock, and Waterford, and the County of Stanislaus.

This report summarizes the results of the 2021/2022 update for the City of Ceres (City) and its purpose is to help educate policy makers about the current condition of the pavement network.

The City's pavement network consists of 134.0 centerline miles of streets, which represents a substantial investment of approximately \$142 million. In 2021 and 2022, NCE collected pavement condition data using the Metropolitan Transportation Commission's (MTC) modified ASTM survey procedures. The survey data were entered into the StreetSaver® database, which the City uses as a PMP decision-support tool.

Overall, the City's pavement network is currently in "Fair" condition with an average pavement condition index (PCI) of 68. Approximately 55.9 percent of the network is in "Good" condition while 17.2 percent is in "Poor" or "Failed" condition.

Pavement Condition Map

1 Introduction and Background

In 2021, the Stanislaus Council of Governments (StanCOG) solicited interest among its member agencies in participating in a collaborative region-wide pavement management program (PMP) update. The last region wide PMP update was performed in 2013. Based on agency participation, StanCOG developed a cooperative agreement for a jointly funded PMP update, contracted out the work, and provided contract and project oversight.

The engineering consultant acquired to provide professional and technical services for the PMP updates in the Stanislaus region was Nichols Consulting Engineers, Chtd. (NCE). The ten participating member agencies included the Cities of Ceres, Hughson, Modesto, Newman, Oakdale, Patterson, Riverbank, Turlock, and Waterford and the County of Stanislaus.

In general, PMPs are “designed to provide objective information and useful data for analysis so that... managers can make more consistent, cost effective, and defensible decisions related to the preservation of a pavement network.”¹

The goals of the 2021/2022 update were to:

- Update the existing pavement network inventory to include new streets,
- Perform pavement condition surveys,
- Update historical maintenance records (e.g. previously resurfaced pavements),
- Update the maintenance and rehabilitation decision tree and associated costs,
- Perform budgetary analyses and determine funding needs, and
- Prepare a final PMP report documenting the results of the update.

To update an agency’s PMP, NCE performed condition surveys using the Metropolitan Transportation Commission’s (MTC) modified² ASTM D6433³ survey procedures. The surveys did not include non-pavement issues such as traffic, safety and road hazards, geometric issues, shoulders, sidewalks, curb and gutters, drainage issues, or immediate maintenance needs. All survey data were entered into the City’s StreetSaver® database, and pavement condition index (PCI)

¹ AASHTO “Guidelines for Pavement Management Systems”. American Association of State Highway and Transportation Officials, Washington, DC, July 1990.

² PCI Distress Identification Manuals (AC 4th Edition, PCC 3rd Edition), Metropolitan Transportation Commission, San Francisco, CA March 2016.

³ ASTM D6433-18 Standard Practice for Roads and Parking Lots Pavement Condition Index Surveys, ASTM International, West Conshohocken, PA, 2018, www.astm.org.

calculations were performed. NCE then met with agency staff and reviewed and updated the City's decision tree including maintenance and rehabilitation (M&R) strategies and treatment unit costs.

This report answers the following questions for the City of Ceres (City):

- What does the City's pavement network include?
- What is the current condition of the pavement network?
- What are the City's current M&R strategies?

2 Network Summary

The City is responsible for maintaining approximately 134.0 centerline miles of streets (961 pavement sections). The network is predominantly composed of asphalt concrete (AC) pavement with just 2 surface treated (surface seal over native soil) sections. Table 1 summarizes the street network by functional classification.

Table 1. Network Summary Statistics

Functional Class	Number of Sections	Centerline Miles	Lane Miles	Network Area (%)
Arterials	79	17.2	40.1	19.5
Collectors	105	24.5	49.1	17.0
Residential	777	92.3	184.6	63.5
Total	961	134.0	273.8	100.0

The street network replacement cost is estimated to be approximately \$142 million. This can be viewed as the value of the pavement network and is the amount needed to fund a reconstruction of the entire paved network. It does not include related infrastructure assets such as sidewalks, signals, markings, signs, or storm drains.

3 Pavement Condition

Pavement condition is typically quantified using the pavement condition index (PCI), which ranges from 100 (best) to 0 (worst). Pavement condition is affected by the environment, traffic loads and volumes, construction materials, and age. Figure 1 shows examples of streets with varying PCIs.

The PCI scale is divided into four general condition categories. Pavements in "Good" condition have a PCI above 70, pavements in "Fair" condition have a PCI between 50 and 69, pavements in "Poor" condition have a PCI between 25 and 49, and finally pavements in "Failed" condition have a PCI below 25.

Figure 1. Examples of Streets with Different PCIs

A list of all sections in the network along with their attributes, including the PCI at the time of last inspection, is provided in Appendix A. For convenience, two versions are provided – one sorted alphabetically by street name and the other sorted by descending PCI.

The current average PCI for the City's network is 68. This value is an area-weighted calculation performed in StreetSaver® and is based on the condition survey performed in 2021-2022. Figure 2 breaks down the current network PCI by functional classification. As shown, the residential streets have the highest condition with an average PCI of 70 while the collectors have the lowest average condition with a PCI of 63. The average PCI for the residential streets is in the "Good" condition category, while the arterials and collectors average PCIs fall within the "Fair" condition category.

Figure 2. Network Condition Breakdown by Functional Classification

Figure 3 shows the City's average network PCI compared to other StanCOG agencies as well as the statewide average PCI from the 2020 California Statewide Local Streets and Roads Needs Assessment⁴. As illustrated, the City's average network PCI is in the middle range of the StanCOG agencies and is a few points above the 2020 statewide average.

⁴ "California Statewide Local Streets and Roads Needs Assessment 2020 Update". Nichols Consulting Engineers, Chtd., CA, 2021.

Figure 3. Comparison of Network PCI to Other StanCOG Agencies

Table 2 summarizes the pavement network by condition category and functional classification. Over half of network is in “Good” condition, with approximately a quarter in “Fair” condition. Approximately 15.8 percent of the network is in “Poor” condition with 1.4 percent in “Failed” condition. A map illustrating the current pavement condition is provided in Appendix C.

Table 2. Pavement Condition Breakdown by Functional Class

Condition Category	PCI Range	Arterial (%)	Collector (%)	Residential (%)	Entire Network (%)
Good	70-100	11.0	7.7	37.2	55.9
Fair	50-69	3.9	4.8	18.2	26.9
Poor	25-49	3.9	4.4	7.5	15.8
Failed	<25	0.7	0.1	0.6	1.4
Total	-	19.5	17.0	63.5	100.0

4 Maintenance and Rehabilitation Strategies

The City's current M&R strategies include cost-effective preventive treatments. In general, crack seals with a slurry seal or microsurfacing will be applied to pavements in "Good" condition; pavements in "Fair" condition will receive a cape seal or a thin hot mix asphalt (HMA) overlay; pavements in "Poor" condition will receive a thicker HMA overlay; finally, pavements in "Failed" condition will receive full-depth reclamation (FDR) with an HMA overlay. The City's M&R strategies are formalized into a decision tree⁵ (presented in Appendix B).

Experience and research have shown that it costs much less to maintain pavement in good condition than to repair pavement that has already failed. As shown in Figure 4, by allowing pavements to deteriorate, streets that once cost \$6.00/square yard (SY) to seal may soon cost \$48.00/SY to overlay, or \$96.00/SY to reclaim. In other words, delaying repairs can significantly increase M&R costs. Note that microsurfacing can be placed on approximately 16 times as many lane miles as those requiring FDR.

Figure 4. Costs of Maintaining Pavements Over Time

⁵ Note: The StreetSaver® "Maintenance and Rehabilitation Decision Tree" divides the "Fair" condition category to separate pavements with primarily non-load-related distresses (e.g., longitudinal cracking) from those with load-related distresses (e.g., fatigue cracking).

5 Conclusion and Recommendations

In summary, the City of Ceres has a substantial investment of \$142 million in the pavement network. Overall, the City's streets are in "Fair" condition with a 2022 average network PCI of 68. Approximately 55.9 percent of the street network is in "Good" condition and 17.2 percent is in "Poor" or "Failed" condition.

Based on the data collected and presented in this report, NCE offers the following recommendations.

1. **Funding** - The primary goal of PMPs should be to offer users a safe and functional pavement network without unduly increasing the maintenance burden in the future. With that in mind, NCE recommends the following potential funding sources:

Federal Funding Sources

- Bipartisan Infrastructure Investment and Jobs Act (IIJA)
- Regional Surface Transportation Program (RSTP)
- Surface Transportation Program (STP)
- Congestion Mitigation and Air Quality Improvement Program (CMAQ)
- Community Development Block Grants (CDBG)
- Highway Safety Improvement Program (HSIP)
- Federal Emergency Management Agency (FEMA)

State Funding Sources

- Active Transportation Program (ATP), which now includes the Bicycle Transportation Account (BTA) and Safe Routes to Schools (SR2S)
- State Transportation Improvement Program (STIP)
- AB 2766 (vehicle surcharge)
- Vehicle License Fees (VLF)
- CalRecycle grants
- State Water Resource Control Board
- Transportation Development Act (TDA)
- Traffic Safety Fund
- Transportation Uniform Mitigation Fee (TUMF)

Local/Regional Funding Sources

- Sales tax measures (Measure L)
- Development impact fees
- General funds
- Various assessment districts (lighting, maintenance, flood control, community facilities)
- Traffic impact fees
- Utilities (e.g., stormwater, water, wastewater enterprise funds)

- Parcel/property taxes
 - Vehicle registration fees
 - Vehicle code fines
2. **Pavement Management Strategies** – Since a significant portion of the City’s streets are currently in “Good” condition (55.9 percent), it is important to maintain that condition to the extent possible. Preservation occurs when streets with PCIs higher than 70 receive treatments such as surface seals (slurry, chip, microsurfacing, etc.). Seals are relatively inexpensive treatments that prevent moisture ingress and thus preserve the integrity of the underlying base material. NCE recommends that the City balance preventive maintenance with rehabilitation and reconstruction projects to preserve pavements in “Good” condition, improve pavements in “Poor” condition, and avoid increasing the deferred maintenance.
3. **Reinspection Strategies** – In order to make appropriate management decisions based on current data, NCE recommends that the City perform condition inspections on arterials and collectors every 2 years and on residential at least every 4 to 5 years. Additionally, since StreetSaver® and other prediction models do not yet take into account the effect of specialized materials such as asphalt-binders with rubber or polymers, the actual performance of city pavements may not be fully captured in the analysis models. For this additional reason, NCE recommends regular pavement condition surveys to ensure model accuracy and relevance.
4. **M&R Decision Tree** – NCE recommends that the City annually review and update the M&R treatment strategies and associated unit costs to reflect current construction techniques and changing costs. This will ensure that the results for the budget analyses are reliable and as accurate as possible.

Appendix A

SECTION DESCRIPTION INVENTORY

Section Description Inventory Report

This report lists a variety of section description information for each of the City's pavement sections. It lists the street and section identifiers, limits, number of lanes, functional class, surface type, length, width, area, Inspected PCI, and PCI date.

All of the City's pavement sections are included in the report. Two versions of the report are provided. The first is sorted alphabetically by Street Name and Section ID and the second report is sorted by descending PCI. The field descriptions in this report are listed below:

COLUMN	DESCRIPTION
Street ID	Street Identification - A code up to ten characters/digits to identify the street. Generally, the street name is truncated to six characters. The Street ID should be unique for each street.
Section ID	Section Identification - A code up to ten characters/digits to identify the section number. The Section ID must be unique for each section of one street.
Street Name	Street Name - The name of the street as indicated by street signs in the field.
Begin Location	Beginning limit of the section.
End Location	Ending limit of the section.
# of Lanes	Number of travel lanes.
Functional Class (FC)	Functional Classification: C = Collector, NCR = Non-City Road, R = Residential, RMaC (rural Major Collector), UMIA = Urban Minor Arterial, UPAO = Urban Principal Arterial Other
Length (ft)	Length of the section in feet.
Width (ft)	Average width of the section in feet.
Area (sf)	Area of section in square feet.
Surface Type (ST)	Surface Type: AC = Asphalt Concrete, AC/AC = Asphalt Concrete Overlay, ST = Surface Treated
PCI Date	The last inspection date or rehabilitation date.
PCI	Average PCI for the section. The value is based on the last inspection.

MAINTENANCE AND REHABILITATION DECISION TREE

Maintenance and Rehabilitation (M&R) Decision Tree

This report presents the current maintenance and rehabilitation decision tree that exists in the database. The decision tree forms the basis for all of the budgetary computations included in this report. ***Changes to the decision tree will make the results in the budget reports invalid.*** All pavement treatment unit costs relevant to the road types in the database were updated.

The decision tree lists the treatments and costs selected for preventive maintenance and rehabilitation activities. Each line represents a specific combination of functional classification and surface type.

The preventive maintenance portion of the report is identified as Condition Category I – Very Good. All preventive maintenance treatment listings are assigned only to sections in Condition Category I where the $PCI \geq 70$. Sections with PCI values less than 70 are assigned to treatments listed in Categories II through V.

In the preventive maintenance category ($PCI \geq 70$), a time sequence is used to identify the appropriate treatment and cost. Each preventive maintenance treatment description consists of three parts: 1) a CRACK treatment, 2) a SURFACE treatment, and 3) a RESTORATION treatment. These three parts allow the user to specify one of three different preventive maintenance treatments depending on the prior maintenance history of the section.

1. The CRACK treatment part can be used to specify the most frequent type of preventive maintenance activity planned (typically crack seals).
2. The SURFACE treatment part can be used to specify more extensive and less frequent preventive maintenance activities, such as chip seals or slurry seals. For example, a crack seal can be specified on a 3-year cycle with a slurry seal specified after 5 years.
3. The RESTORATION part can be used to specify a surface restoration treatment (such as an overlay) to be performed after a specified number of surface treatments. For example, after a certain number of successive slurry seals, an overlay can be specified instead of another slurry seal.

Rehabilitation treatments are assigned to sections in Condition Categories II through V (PCI less than 70). Each line is defined by a specific combination of functional classification, surface type, and condition category.

COLUMN	DESCRIPTION
Functional Class	Functional Classification identifying the branch
Surface	Surface Type identifying the branch number.
Condition Category	Condition Category (I through V).
Treatment Type	First Row (Crack Treatment) indicates localized treatment (e.g. crack sealing). Second Row (Surface Treatment) indicates surface treatment (e.g. slurry sealing). Third Row (Restoration Treatment) indicates surface restoration (e.g. overlay).
Treatment	Name of treatments from the "Treatment Descriptions" report.
Yrs. Between Crack Seals	First Row - number of years between successive treatment applications specified in the first row (i.e. CRACK treatment).

COLUMN	DESCRIPTION
Yrs. Between Surface Seals	Second Row - number of years between successive treatment applications specified in the second row (i.e. SURFACE treatment).
Number of Sequential Seals	Number of times that the treatment application in the second row (i.e. SURFACE treatment) will be performed prior to performing the treatment application in the third row.

Note that the treatments assigned to each section should not be blindly followed in preparing a road maintenance program. Engineering judgment and project level analysis should be applied to ensure that the treatment is appropriate and cost effective for the section.
